                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The target nucleotide sequence was used to demonstrate a method for improving the priming specificity of a non-unique oligonucleotide primer. Preferably the oligonucleotide primer is modified by a radioactive element, a fluorescent modety or a blotin modety. The methods are used particularly for the sequencing of target DNA sequences. The methods using the priming specificity of a non-unique oligonucleotide primer by using differential extension of the primer with nucleotide primer by length discrimination against shorter extensions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lesch-Nyhan syndrome; muscular dystrophy; Wiskott-Aldrich syndrome; Fabrys disease; familial hypercholesterolemia; hereditary spherocytosis; polycystic kidney disease; von Willebrands disease; forensic; human; tuberous sclerosis; hereditary hemorrhagica telangiectasia; familial colonic polyposis; osteogenesis imperfecta; porphyria; Ehlers-Danlos syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Improving priming specificity of oligo:nucleotide primers - by using differential extension of the primer with nucleotide subsets and length discrimination against shorter extensions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a mammalian PGI gene and protein, and a set of PGI biallelic markers. The PGI polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PGI-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Barly-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene; biallelic marker; PCR primer; PG1-related biallelic marker;

                                                                        Marek's disease virus protein and its nucleotide sequence - used to protect chickens against Marek's disease and inhibit the establishment of latency and tumour cell development
                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                 The primers given in AAQ97859-60 were used for the PCR amplification of the upstream region of MDV L1 cDNA. The amplified fragment, Q2L1, was cloned into pBluescript KS+ for sequencing.
                                                                                                                                                                                                                                                                                                         ;

The present invention describes an isolated nucleotide sequence (I) encoding at least a portion of the human alpha-7 neuronal nicotinic acctylcholine receptor (alpha7-hnAChR). Also described are: (1) a peptide encoded by (I); (2) a vector comprising (I); (3) a host cell transformed with a vector of (2); (4) a polynucleotide comprising at least 15 nucleotides which hybridises under stringent conditions to at least a portion of (I); (5) a method for detection of a polynucleotide encoding alpha 7-hnAChR in a biological sample; and (6) a method for amplification of nucleic acid from a sample suspected of containing nucleic acid encoding alpha 7-hnAChR. The primers and probes from the present invention can be used on brain tissue and blood samples of humans suspected of suffering from schizophrenia, small cell lung carcinoma, breast cancer and nicotine-dependent illness. This is particularly useful for diagnosis of schizophrenia. Other illnesses that can be studied/diagnosed are epilepsy (e.g. juvenile myocionic epilepsy) and prader-Willi and Angelman's syndromes.
affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; alpha-7 nicotinic receptor; neuronal; hybridisation; probe;

This sequence is a primer for the human XIIS gene of the invention.

The XLIS fragments may be used to detect abnormalities in the expression of the XLIS gene transcripts or to compare their sequence with that of the XLIS transcripts from patients for in vitro especially prenatal diagnosis of lissencephaly (LIS) (or agyria-pachygyria), subcortical annuar heterotopia (SCLH), cortical dysgenesis, cryptogenic epilepsies or neurodegenerative diseases such as Alzaheimer's disease. These disorders mainly affect females as the XLIS gene is X-linked. The XLIS fragments may also be used to administer to patients to prevent or treat the above disorders and may be used to administer to patients to prevent or treat the above disorders and way be used to administer to patients to prevent or treat the above disorders. They may also be performed by amplifying XLIS connected the mRNA in the sample. Antibodies to XLIS may be used to detect XLIS in the intent the above disorders. They may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above disorders. They may also be administered to patients to prevent or treat the above neurological disorders. In addition XLIS may be used as a marker of neuronal cells at an early stage of development, its discovery increases understanding of both the neuronal movement which leads to the prain and of the fortical and an early stage of development is the leads to the property and the prain and of the prain and of the prain and the total and the prain and the total and the prain and the total and the leads and leads to the leads and leads to the leads and the leads and leads to the leads and the leads and leads the le

The sequences given in AAT42898-901 are single stranded (ss) circular closed of the proliferation of myeloid leukaemia cells. These oligos are specifically targetted to a region in the bcr3/abl2 gene 385 conclideration of myeloid leukaemia cells. These oligos are specifically targetted to a region in the bcr3/abl2 gene 385 conclides 5 to the bcr/abl junction, abd towards the bcr2/abl2 cc nucleotides 5 to the bcr/abl junction, abd towards the bcr2/abl2 cc junction. These so circular oligonuclectides comprise a parablel cc binding (P) domain. The P and AP domains have sufficient complementarity to bind detectably to 1 strand of a defined nucleic acid target. The P domain is capable of binding in an anti-parallel manner to the target and the ends of the P and AP domains are separated by the loop domains. The sc circular oligonuclectides can be used to regulate the synthesis of DNA, RNA or protein (pref. by DNA replication, DNA reverse transcription, RNA splicing, RNA polyadenylation, RNA cranslocation or protein (pref. by DNA replication, Cc regulate the biosynthesis of DNA, RNA or protein in a targetted mammalian tumour cell in vivo, without substantially altering the blosynthesis of LNA, RNA or protein in a targett complex. The blosynthesis of LNA, RNA or protein in a targett complex conclication conclication and double stranded to detect a target nucleic acid by detecting an oligonuclectide-target complex. The circular oligonuclectide can bind both single and double stranded to linear forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single stranded circular oligo:nucleotide comprising parallel and anti-parallel binding domain - used to regulate biosynthesis of DNA, RNA or protein in targetted mammalian tumour cell in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 12.6; DB 17; Length 34; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This primer was used to PCR amplify the promoter sequence from the 40S ribosomal protein S28 gene (AAZ30685) from Aspergillus oryzae. The invention relates to novel gene promoters (AAZ30680-Z30685) isolated from Aspergillus oryzae which can be used in genetic engineering to express heterologous proteins in Aspergillus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A new promoter derived from an Aspergillus genus microbe – useful for
producing exotic proteins

This DNA sequence is a region of a Brassica napus or Brassica oleracea genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Brassica species allele-specific oligonucleotide probes and primers - useful for plant breeding

Sequence 13, Application US/07825959
Patent No. 5372929
GENERAL INFORMATION:
APPLICANT: Cimino, George C.
APPLICANT: Lin, Lilly
TITLE OF INVENTION: METHOD FOR MEASURING THE INACTIVATION OF
TITLE OF INVENTION: PATHOGENS
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Limbach & Limbach
STREET: 2001 Ferry Building
                                                                                                                                                                                                                                                                                                                                           67.0%; Score 13.4; DB 2; Length 43; 93.3%; Pred. No. 5e+02; 1:ve 0; Mismatches 1; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           67.0%; Score 13.4; DB 3; Length 43; 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 4, Application US/09377310B
| Patent No. 6133031
| GBNERAL INFORMATION:
| APPLICANT: Monia, Brett P. |
| APPLICANT: Gaarde, William A. |
| TITLE OF INVENTION: Antisense Modulation of Focal Adhesion Kinase |
| TITLE OF INVENTION: Expression |
| TITLE OF INVENTION: Expression |
| FILE REFERENCE: ISPH-0389 |
| CURRENT APPLICATION NUMBER: US/09/377,310B |
| CURRENT FILING DATE: 1999-08-19 |
| NUMBER OF SEQ ID NOS: 43 |
| SEQ ID NO 4 |
| LENGTH: 20 |

Patent No. 5567583
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: WETHOD FOR DETECTING A TARGET
TITLE OF INVENTION: WICLEIC ACID
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: Fish & Richardson
STREET: 225 Franklin Street
CITY: Mosson
STREET: Massachusetts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      COUNTRY: U.S.A.

ZIP: 02110-2804
COMPUTER READABLE FORM:
MEDIUM TYPE: 3.5" Diskette, 1.44 Mb
COMPUTER: IBM PS/2 Model 502 or 555X
OPERATING SYSTEM: MS-DOS (Version 5.0)
SOFTWARE: WordPerfect (Version 5.1)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/250,849
FILING DATE: 05/26/94
CLASSIFICATION: 435
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 07/808,463
FILING DATE: December 16, 1991
ATTORNEY AGENT INFORMATION:
NAME: Y. ROCKY TSAO
RECISTRATION NUMBER: 34,053

; Sequence 15, Application US/08841267C
; Patent No. 6007990
; GENERAL INFORMATION:
; APPLICANT: Levine, Robert A.
; APPLICANT: Wardlaw, Stephen C.
; TITLE OF INVENTION: Detection and Quantification of One or
; TITLE OF INVENTION: More Nucleotide Sequence Target Analytes in a Sample Using
; Patent No. 6007990
; TITLE OF INVENTION: Spatially Localized Target Analyte Replication
; FILE REFERENCE: UFB-001
; CURRENT APPLICATION NUMBER: US/08/841,267C
; CURRENT FILING DATE: 1997-04-29
; NUMBER OF SEQ ID NOS: 24
; SOFTWARE: FastSEQ for Windows Version 3.0
; SEQ ID NO 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Patent No. 5942418

GENERAL INFORMATION:
APPLICANT: LOOSMOTE, Sheena M
APPLICANT: Yacoob, Reza K
APPLICANT: Zealey, Gavin R
APPLICANT: Zealey, Gavin R
TITLE OF INVENTION: EXPRESSION OF GENE PRODUCTS FROM
TITLE OF INVENTION: GENETICALLY MANIPULATED STRAINS OF BORDETELLA
NUMBER OF SEQUENCES: 57
CORRESPONDENCES ADDRESSE:
ADDRESSEE: Sim & MCBurney
STREET: 6th Floor, 330 University Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

                                         The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a number of phosphorothicate antisense sequences to the human focal adhesion kinase (FAK) protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NAME OF A PART O
```

```
AAT87178-276 are interleukin (IL)-4 RNA ligands obtained after 17 rounds of SELEX (Systematic Evolution of Ligands by Exponential enrichment). The sequences were analysed for conserved sequences and aligned by this criterion. The 2'F sequences fell into a single group with 12 orphan sequences. 2'NH2 sequences fell into 2 distinct groups. Group 1 were shown to bind to IL-4 and the other group were shown to bind to on itrocellulose filters and were identified by the presence of a direct repeat of the sequence GGAGG. A single orphan 2'NH2 sequence was also found to nitrocellulose filters. Nucleic acid (NA) ligands to a cytokine on the case fell into 3 groups, of which one group bound to nitrocellulose filters. Nucleic acid (NA) ligands to a cytokine can be identified using SELEX. A candidate mixture of NA's are contacted with a cytokine where the NA's having an increased affinity to the rest of the mixture. The NA's having an increased affinity to the rest of the mixture of NA's enriched for the NA sequences and relatively higher affinity and selectivity for binding to the cytokine. The NA ligands are useful in diagnostic and therapeutic applications especially to prevent or treat diseases or medical conditions in human patients, coprevent or treat diseases or medical conditions in human patients, copress mediated by IFN gamma or interleukin-4, septic shock, corrections and relatives or praft-version mediated by tumour necrosis
high affinity ligand; cytokine; interferon-gamma; IFN-gamma; RANTES; interleukin-4; IL-4; tumour necrosis factor-alpha; TNF-alpha; Systematic Evolution of Ligands by Exponential enrichment; SELEX; diagnosis; inflammatory response; septic shock; arthritis;

The sequences were analysed for conserved sequences and aligned by this criterion. The 2'F sequences fell into a single group with 12 orphan sequences. 2'NH2 sequences fell into 2 distinct groups. Group were shown to bind to IL-4 and the other group were shown to bind to introcellulose filters and were identified by the presence of a direct repeat of the sequence GGAGG. A single orphan 2'NH2 sequence was also found. The 2'F/NH2 sequences fell into 3 groups, of which one group bound to nitrocellulose filters. Nucleic acid (NA) ligands to a cytokine can be identified using SELEX. A candidate mixture of NA's are contacted with a cytokine where the NA's having an increased affinity to the cytokine relative to the candidate mixture may be partitioned from the cytokine relative to the candidate mixture may be partitioned from the cytokine relative to the candidate mixture may be partitioned from the cytokine relative of NA's with increased affinity are amplified to yield a mixture of NA's with increased affinity are amplified to yield a mixture of NA's enriched for the Na sequences and relatively higher affinity and selectivity for binding to the cytokine. The NA ligands are useful in diagnostic and therapeutic applications sepecially

When labelled with a fluorophore, the blocking oligonucleotide can also be used to monitor the amplification process by participating in fluorescence energy transfer. This energy transfer can be enhanced by using the blocking oligonucleotide as a template for ligation of its complementary sequence to the primer. In an example, the human acute myeloid leukaemia breakpoint related sequence was asymmetrically amplified using an excess primer and a limiting primer (see AAT09719 and AAT09720, respectively). The
                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymerase chain reaction; amplification; non-specific priming; blocking oligonucleotide; donor; acceptor; fluorophore; energy transfer; ligation; AML-1; acute myeloid leukaemia; breakpoint related sequence; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        amplification process could be monitored using either a primer;
blocking oligonucleotide duplex or a universal detection duplex

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the human acute myeloid leukaemia breakpoint related sequence (AMP-1), and the human x chromosome specific ameloginen (AMG-X) were used as amplification tragets. The sequences of the primers used for AML-1 and AMG-X respectively were AAT45479 and AAT45480, the duplex comprised AAT45481 and AAT45482 and the sequences of excess and limiting primers for AML-1 and AMG-X respectively were AAT45483 and AAT45484, and AAT45485 and AAT45486. Male human genomic DNA sequences were asymmetrically amplified with excess primer for the addition of the primer duplex. The results compiled from detection at cycle 30 demonstrated the quantitative

This is a limiting primer used in a kit for detecting a target nucleic acid of human acute myeloid leukaemia breakpoint related sequence (admi-1). The kit is a DNA duplex which comprises a first oligonucleotide of acting as a primer, with or without a segment noncontiguous to its priming sequence, for use with a polymerase in the amplification of a target nucleic acid, a second oligonucleotide bairings, with the first oligonucleotide, the second oligonucleotide pairings, with the first oligonucleotide, the second oligonucleotide pairings, with the first oligonucleotide, the second oligonucleotide and a second fluorophore covalently attached to the first oligonucleotide, with one of the two fluorophores of acting as a primer for the polymerase, and a first fluorophore covalently attached to the second oligonucleotide, with one of the two fluorophores of being a donor fluorophore and the other being an acceptor fluorophores of that when the two fluorophores are in close proximity resonance energy transfer between them is allowed. Each of the first oligonucleotide contains 10-50 nucleotides. Another kit claimed comprises a first and second primer both optionally having a sepment non-contiguous to a first or second primin sequence, respectively, which are used with a polymerase for the amplification of the first primer. Each of the first primer is along an oligonucleotide with is incapable of acting as a primer for the polymerase and has at least 5 consecutive nucleotides contains 10-50 nucleotides with a first fluorophore covalently attached to it, and second containing 10-50 nucleotides with a first fluorophore covalently attached to it, and a second oligonucleotide being incapable of containing 5-30 nucleotides with a second oligonucleotide and the second containing a second oligonucleotide with a second containing 5-30 nucleotides with a second oligonucleotide such the first oligonucleotide and the first oligonucleotide is and of the second containing 5-30 mucleotides with a second oligonucleotide such the firs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.

known genetic mutations, using modified mucleoside triphosphates to improve the performance. The method comprises: (1) amplifying a DNA sequence by polymersae chain reaction (PCR) using primers selected to sequence by polymersae chain reaction (PCR) using primers selected to of modified nucleoside triphosphates (NPPS) to effect limited extension of already present or newly added primers, where: (a) the extension of cartion stops at the next occurrence of a particular base in the DNA strand being copied; (b) the extension reaction proceeds up to or past the mutation site, so that wild-type amplification products will have a different molecular weight from mutant amplification of the DNA chains during ionization of the NTPs results in stabilization of the DNA chains during ionization yields and/or a change in the mass of the DNA chains; (3) performing the limited primer extension using an enzyme that generates the complement of the DNA strand being copied; (4) performing at least partial primer degradation and optionally further modification of the maplification products; and (5) determining the mass of the DNA chains; (3) performing the limited primer products; and (5) determining the mass of the considered of the maplification products; and (5) determining the mass of the considered of the maplification products; and (5) determining the mass of the considered of the maplification and optionally further modification and the mass of the considered of the maplification and optionally further modification and the mass of the considered of the maplification and optionally further modification and the mass of the considered of the maplification and performing the mass of the considered of the maplification and optionally further modification and the mass of the considered of the maplification and optionally further modification and the mass of the considered of the maplification and optionally further modification and the mass of the considered of the mass of the considered of the mass of the considered of the mass o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          modified amplification products by mass spectrometry and assigning the masses to wild type or mutant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                               The specification describes a new regulatory sequence for Trichoderma viride derived cellulase cbhi gene and the establishment of a system for mass producing cellulase in moulds such as T. viride. As the regulatory sequence of cbhi genes originating in T. viride can highly express objective proteins, proteins such as cellulase can be expressed. An expression vector containing the regulatory sequence and Hunicola insolens derived endo-glucanase NCE4 DNA was produced, and used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Coupled polymerase chain reaction; PCR; ligase detection reaction; LDR; restriction endonuclease digestion; RED; infectious disease; cancer; waste water purification; ds.
                                                                                                                                                                                                                                                                                                                                                      Oligonucleotides AAV36074-75 are used in the course of the invention.

The specification describes the use of coupled polymerase chain reaction (PCR), restriction endonuclease digestion (RED) and ligase detection reaction (LDR) to identify one or more low abundance sequences differing by one or more single base changes, inserts or deletions, from a high abundance sequence, in several target nucleotide sequences. The method involves 3 PCR reaction phases, a RED phase and an LDR phase. The method is used to identify one or more low abundance sequences. The method is also useful for detecting a wide variety of infectious diseases caused by acterial, viral, parasite and fungal infectious agent. Cancers can also be detected by this method. The method is also used for detection, identification and monitoring of pathogenic and indigenous municipal waste water purification system and water reservoirs or in polluted areas undergoing bioremediation and to detect plasmids containing genes that can metabolise xenoblotics, to monitor specific target microorganisms in population dynamic studies, or either to detect. Indentify, or monitor specific target microorganisms in the environment and in industrial plants. The presents sequence represents a synthetic duplex DNA template, used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                         ó
                                                                                                                                                                                     The present invention describes an enzymatic nucleic acid molecule which specifically cleaves RNA derived from a c-fos gene. AAV95401 to AAV95540 and AAV95541 to AAV95584 represent hammerhead ribozymes and hairpin
                                                                                                                                                                                                                 ribozymes, respectively, which specifically cleave human c-fos. AAV95261 to AAV95400 and AAV95385 to AAV95628 represent human c-fos target sequences. The enzymatic nucleic acid molecules can be used for treating cancer associated with elevated levels of c-fos oncogene, especially leukaemias, neuroblastomas and lung, breast and colon cancers. The ribozymes may also be used as diagnostic tools to examine genetic drift and multiplications within diseased cells, or to detect the presence of c-fos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA8415 to AAA86787. The ribozyme of the invention is useful for Inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention is used in producing a recombinant organism that can be used to express SLGGA4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Polymorphic some variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular ILARalpha protein isoform, an expression of a particular ILARalpha protein isoform, an expression desirable to decrease or block expression of a particular ILARalpha sogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a PCR primer for human ILAR-alpha.

The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a translational reporter vector selected from p2luc and p2luci. The vectors have a polylinker interposed between a renilla luciferase gene and a firefly luciferase gene, which are out-of-frame with respect to each other but are co-expressed upon recoding. The translational reporter vector is useful for assaying translational recoding in vitro or in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Translational reporter vector for quantification of translation recoding in vivo and in vitro, comprises renilla luciferase gene, polylinker for insertion of selected DNA and an out-of-frame firefly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension of diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential cutys which combat the disease. The polymorphisms can be tested for association with other diseases. The polymorphisms can be tested for association with other diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               per primers AA245392-93 were used to amplify rat acyl-CoA:cholesterol acyltransferase (ACAT)-like gene. The ACAT-like protein is active in the formation of a sterol, ester and/or triacylglycerol from a fatty acyl-CoA and sterol and/or diacylglycerol substrate. The DNA can be used for modifying the lipid composition of plant cells. The ACAT-like protein has diacylglycerol acyltransferase (DAGAT) activity, and so the synthesis of triglycerides can be suppressed or increased using the DNA. The protein can be used to produce plant oils with a modified triglyceride content. The products can also be used to identify antagonists and agonists of DAGAT activity. Such agonists and antagonists are particularly useful in treating or ameliorating diseases associated with DAGAT activity, including concentration or PKC activity, including cancer, diabetes, concentration or PKC activity, including cancer, diabetes, cardiopulmonary diseases e.g. heart failure, atherosclerosis, adisorders, obesity, diseases associated with abnormal lipid metabolism, and diseases associated with abnormal fat absorption,
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotides used for modifying plant oil composition and for developing products for treating e.g. cancer, diabetes, cardiopulmonary disease or metabolic disorders
cardiopulmonary disease; heart failure; atherosclerosis; adipocytosis; leukaemia; skin carcinoma; fibroblastoma; metabolic disorder; obesity; abnormal lipid metabolism; abnormal fat absorption; lipoprotein secretion; adipogenesis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to nucleic acids encoding novel plant acyltransferase-like proteins (AAA37343-A37445) which comprise one of a conserved acyltransferase motifs (AAY9944-Y99481). Acyltransferases catalyse the transfer of acyl groups from a donor to a variety of substrates such as glycerides, sterols, stanols and phosphatides.

Such enzymes play a key role in lipid synthesis, and thereby affect the characteristics of the plant. For example, cold-hardened plants have different lipid concentrations in the cell membrane compared to non-hardened plants, which makes the membrane more fluid and the plant mon-hardened plants, which makes the membrane sequences of the rowention can be used as probes or for expressing acyltransferase-like proteins in host cells e.g., for recombinant protein production. They may be expressed in plant cells to alter the lipid composition of the production of chill-resistant plants, or for altering the composition of plant oils. Sequences AAA33473-AA344 represent PCR primers used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cDNAs (AAA37331-A37342) for cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Prenyltransferase; ATPT1; ATPT2; ATPT4; ATPT4; ATPT5; ATPT6; ATPT7; ATPF8 ATPT9; ATPT8; ATPT9; ATPT11; ATPT12; tocopherol; homogentisic acid; phytylpyrophosphate; 2-methyl-6phytylbenzoquinol; antioxidant; nutritional supplement; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the markers and a heterologous sequence are useful in gene therapy. The vectors can be used to deliver a molecule into a target area where it may cause the activation of a previously inactive substance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primers AAV42720-21 were used to amplify human furin cDNA (see AAV42731). The amplified product is used in the retroviral vector of the invention to encode a cell bound prodrug convertase for ablation therapy. The specification describes encode a cell specification describes expression of a non-immunogenic selectable marker or molecule which is capable of activating a previously inactive compound. The invention relates to raising a neutralising antibody response to a broad spectrum of HIV (human immunodeficiency virus) strains and isolates, comprising the administration of a peptide which corresponds to or mimics highly conserved portions of the gp41 envelope glycoprotein which are important in mediating the process of viral entry into host cells. Such peptides can correspond to or mimic the coiled coil solution structure of the N-helical domain (the heptad repeat region), or can correspond or mimic the C-helical domain (the transmembrane-proximal amphipathic alpha-helical domain (the pp41 core 6-helix bundle, which is formed by the interaction of the N- and C-helical domains of three gp41 proteins. The peptides can be administered either singly or as a combination (particularly multimerised. For example, N- and C-helical domain peptides can be alternately linked together to form a peptide which mimics the core alternately linked together to form a peptide (s) generates a humoral response, with the production of antibodies against gp41 structures involved in viral entry. As these portions of gp41 are well conserved,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Raising neutralizing antibody response to human immunodeficiency virus, comprises administering a polypeptide capable of forming a stable coiled-coil solution structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HIV-1; gp41; N-helical domain; heptad repeat region; C-helical domain; gp41 transmembrane-proximal amphipathic alpha-helical segment; core 6-helix buddle; viral entry inhibition; immunogenic; antibody; humoral response, broad spectrum vaccine; anti-HIV; envelope glycoprotein; prophylaxis; therapy; PCR primer; ss.

such antibodies may be effective against a broad range of HIV strains and isolates. The peptide compositions may be administered as a prophylactic or therapeutic vaccine to generate antibodies which reduce or inhibit the ability of HIV to infect uninfected cells. A composition comprising polyclonal or monoclonal antibodies can be administered to reduce HIV infection of uninfected cells. Antibodies raised against entry relevant gp41 structures may also be used therapeutically and as tools to further elucidate the mechanism of HIV cell entry. Sequences AAA72104-A72107 represent PCR primers used in an exemplification of the invention to construct DNA (AAA72102) encoding a protein construct (AAB14603) comprising the N- and C-helical domains of HIV-1 gp41 separated by a short peptide linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a PCR primer for the mouse ribonucleotide reductase R1 (RRR1) gene. The gene and the protein it encodes can be used in the methods of the invention for modulating tumourigenicity of neoplastic cells in a mammal. The RRR1 can slow tumour growth and cause tumour regression and reduction of tumourigenicity and metastatic
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of ribonucleotide reductase R - for modulating the tumourigenicity and metastatic potential of neoplastic cells in a mammal, particularly for inhibiting tumour growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5-8 of the human methylthiodenosine phosphorylase (MTAP) gene on chromosome 9p21 (see AA23531). The primer is used, with an antisense primer (see AA235375), in a PCR amplification (505 bp product) in step (a) of claimed methods for diagnosis of, and determining a prognosis for, cancer causatively associated with canagements of chromosome 9p21. Step (a) of these methods involves determining whether any portion of the 9p21 chromosome involves determining whether any portion of portion of the gene encoding MTAP is deleted, or whether any portion of 9p21 centromeric to STS 3.21 is deleted, or whether any portion of the gene coding for p16 is deleted. The results are indicative of a cancer at an early stage of tumour development. Primer pairs (see AZ23534-75) are provided for use in the claimed methods, where the cancer is a glioma, primary lymphoid malignancy, non-small cell lung cancer, and cancer, metanome of a cancer, ovarian cancer, hladar cancer, and challend and challend and challend and challend and challend and cancer, ovarian cancer,

                                                                                                                                                                                                                                  25-APR-2000
     The invention relates to a mammalian PGI gene and protein, and a set of PGI ballelic markers. The PGI polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an a lale-specific amplification assay for determining the identity of a nucleotide at a PGI-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative cand curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the cuture, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                              PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of a prostate cancer associated gene and biallelic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 47;

Sequences AAA38349-A3838 represent antisense oligonucleotides targetted to the human Ets-2 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human Ets-2 RNA, and were designed to target different regions of the human Ets-2 RNA, and were analysed for their effect on Ets-2 RNA levels by quantitative real-time PCR. The Ets-domain transcription factors are a family of proteins which are involved in controlling key cellular events such as proliferation, differentiation and development. The Ets domain is a DNA-binding domain shared by all members of this family. Through this motif, Ets family members bind to the promoter regions of various genes at a GCA consensus sequence, thereby acting as either repressors or activators of the gene. All but one Ets family protein bind to DNA as monomer. Ets-2 has been implicated in the regulation of cellular proliferation and differentiation. The Ets-2 gene is located at chromosome 21q22.3, which is within a region known to undergo translocations associated with malignancies. Ets-2 has been found to be upregulated in several cancers, including lymphoblastic leukaemia. It may also play a role in the cancer phenotype, as it activates the urokinase plasminogen activator to epidermal growth factor (EGF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      stimulation. High levels of uPA and metalloproteinases are associated with tumour invasion and metastasis in breast cancers. As the Ets-2 gene is located on chromosome 21, which is triplicated in Down's syndrome, it is also thought to be responsible for the skeletal abnormalities present in this condition. The antisense oligonucleotides of the invention are useful for the treatment or prophylaxis of conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                   Antisense compound, 8-30 nucleobases in length, inhibiting the expression Ets-2 is useful for treating cancer and detecting Ets-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

AAA29335-38 are oligonuclectide primers used to synthesize the alpha and beta chain cDNA for a MAGE-1 specific T cell receptor from the CD8 positive cytotoxic T lymphocyte (CTL) clone 82/30. Novel immune cells with predefined specificity, are produced by either complexing the cells with an antigen specific MHC-restricted TCR or transfecting the cells on thigher specific MHC-restricted chimaric TCR gene. The antigen-specific MHC-restricted chimaric TCR gene. The antigen-specific MHC-restricted chimaric TCR gene can be transfected with lymphocytic cells for treatment of a tumour. Alternatively, the autologous climents of the transfected with an antigen associated with the tumour and a segment encoding a single chain TCR (scFv-TCR) which binds to an antigen associated with the tumour and a segment encoding a signal transducing element of an immune cell. Compositions comprising the manner cells may be used for the treatment of cancer (especially melanomas, if the TCR binds to the MAGE-1 antigen), infectious diseases, cutoimmune disease and/or graft rejection.
                                                                                                                                   human leukocyte antigen; HLA-A1; melanoma; neoplastic; MAGE-1; TCR; MHC; soluble; major histocompatability complex; antigen; T cell receptor; lymphocyte; tumour; cytostatic; anti-microbial; immunosuppressive; primer; alpha chain; ss.

Sequence 2, Application US/09087232A
Patent No. 6153431
GENERAL INFORMATION:
APPLICANT: QUILLENT Et al.
TITLE OF INVENTION: HUMAN IMMUNOBEFICIENCY VIRUS CO-RECEPTOR
TITLE OF INVENTION: VARIANTS ASSOCIATED WITH RESISTANCE TO VIRUS INFECTION.
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSEE: Baker & Botts, L.L.P. attn. Lisa Kole
STREET: 30 Rockefeller Plaza
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a PCR primer for DNA encoding a cellulose synthase of the invention. The DNA can be used for controlling cellulose synthesis in a cell by introducing the DNA into the cell, expressing RNA with a nucleotide sequence homologous to the DNA or a nucleotide sequence complementary to the DNA. The cells are prokaryotic cells i.e. acetobacterium and/or eukaryotic cells such as yeasts
                   The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development discreters, angiogenic discreters and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                      Gaps

The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                      Human; focal adhesion kinase; FAK; signal transduction; cancer; embryonic development disorder; angiogenic disorder; wound healing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BMP type II receptor kinase-3; BRK-3; bone morphogenetic protein; primer; PCR; polymerase chain reaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 20;

This primer corresponds to the sequence of plasmid pSPORTI/N89-5, and is the reverse complement of nucleotides 968-948 in a gene encoding mouse bone morphogenetic protein (BMP) receptor type-II kinase-3 (BRK-3), which induces cellular differentiation in response to BMP. The primer may be used with anchor primer AAT27231 in 5'-rapid amplification of CDNA ends (5'-RACE), to isolate 600 bp at the 5'-end of the BKR-3 gene, by PCR amplification of NIB3T3 mouse embryo fibroblast (ATCC CRL 1658) cDNA. To reduce background, a 2nd round of PCR is performed using nested primer AAT27232 with the anchor primer. This results in isolation of 600 bp from the 5'-end of the gene, which may be used to assemble a full-length clone (AAT27225) by PCR using primers AAT2723-4 and cloning in phage Bluescript-II-SK(-) in Escherichia coll DH5-alpha. The receptor and antibodies against the may be used in diagnostic assays for BMP disorders, or in the angle of the book of the coll DH5-alpha. The receptor and antibodies against the may be used in diagnostic assays for BMP disorders, or in the angle of the coll DH5-alpha. The receptor and antibodies against the angle be used to assays for BMP disorders, or in the coll DH5-alpha.

                                                                                                                                                                                                                                                                                                                                                                                        A PCR primer (AAT28037) Includes the reverse complement of a partial cDNA clone isolated from NIBT3 mouse embryonic fibroblasts. It was used with an anchor primer (AAT28038) to amplify the 5' end of mouse bone morphogenetic protein (BMP) type receptor kinase protein-3 (BRK-3) cDNA. Following further PCR amplification and cloning into pUT6, a cDNA clone (AAT28020) coding for full-length murine BRK-3 (AR855224) was obtd. The PCR primer is the reverse complement of nucleotides 968-948 of this clone.
                                                                                                                                                                                                                                                                         Assays for bone morphogenetic protein activities - using complex of BMP type I receptor kinase protein and BMP receptor kinase protein BKR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·,

                                                    frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be contributing factor in heart disease, sarcoidosis, sinusitis, purulent otits media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX3684-AAX36879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensize, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New PR domain peptides comprising amino acid sequences from, for example retinoblastoma-interacting zinc finger, or egl-43 proteins, for regulating gene transcription and controlling cell proliferation and differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (Rb) interacting zinc finger (RIZ) protein (AAB12028). RIZ is a nuclear phosphoprotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to Rb protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate transcription. RIZ functions to maintain cells in the Gl phase of the cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell proliferátion; celí differentiation; tissue repair;

serotypes of group A streptococci, and may therefore be used as vaccines to protect against and control infection by type A streptococci. Type A streptococci are not only responsible for streptococcal pharyqitis (strep throat), forms of pneumonia and a condition resembling toxic shock, but are also involved in the development of acute rheumatic fewer (ARF) and rheumatic heart disease. In a patient with ARF, antibodies formed during a group A streptococcal infection are also cross-reactive with heart tissue, which indicates that the streptococci and host tissue contain similar antigenic motifs. The new multivalent various serotypes of group A streptococci antibodies against various serotypes of tissue, sequences AAA57903-A57904 and AAA579919 represent PCR primers used in the generation of DNA (AAA57893-A57912) encoding multivalent thybrid Streptococcus pyogenes M proteins (AAB03113-B03117, and a part of the generation of DNA (AAA57893-A57902) encoding

nucleus. RIZ gene mutations may be implicated in various cancers such as melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may be used in gene therapy for these disorders. Since RIZ protein is implicated in cell cycle arrest, inhibition of RIZ activity may be useful in neurodegenerative disorder therapy e.g. for Parkinson's, Huntingdon's or Alzheimer's disease, paralysis or motor neurone disorders, or cardiac disorders e.g. heart disease, where the ability to induce neural, cardiac tissue proliferation would be useful. The present sequence was used in the construction of vectors which were used to clone
